

Perimeter Protection and Intruder Detection

ICU uses a highly sophisticated form of Video Motion Detection technology to protect an area from intrusion. The software continuously tracks the movement of objects across the screen. A virtual tripwire or region is drawn on the screen and whenever this perimeter is breached the event is recorded and an alarm raised.

ICU systems can permit objects to travel in one direction while generating an alarm for movement in the opposite direction. This software overcomes many of the nuisance alarm issues traditionally associated with VMD and does so while maintaining accurate detection.

Applications.

- Detect intruders in restricted areas
- Detect when an outer perimeter has been breached
- Detect vehicles and people traveling in the wrong direction
- Highly effective in external areas where conventional intruder detections systems may fail
