

Remote Monitoring

anywhere anytime access

With the revolution in new CCTV technologies, greater accessibility to higher bandwidth communication, the roles played by CCTV continue to expand. New capabilities include:

- CCTV can be sent over the internet
- Digital Video Recorders and PCs for powerful configurations
- Motion detection with analytical software that triggers emails, texts, or calls

Migration toward IP based solutions that integrate with existing systems, the intranet and internet provide hitherto inconceivable services.

With all these new building blocks available, the permutations and applications are all but limitless. Often organisations do not realise how CCTV can improve their services. ICU applies lateral thinking for outside-the-box tailor made solutions that deliver real value.

Anyone who has ever had to respond to a call from an Alarm Response Centre at 2am will appreciate our remote viewing feature. Just login with any device with internet access, look and listen to your site and determine if a physical inspection is necessary. This constitutes a great improvement in service for those unsubscribed to an ARC.

Stuck in a queue in the bank while worried about your business? View your site on your mobile and put your worries to rest.

“ Save the cost of manned security at multiple sites by monitoring every site on one screen.

Practical application: A customer of ICU was alerted of motion detection outside of working hours. The customer logged in and saw that a pipe had burst, contacted a plumber and prevented thousands of pounds worth of further damage.

ICU (Europe) Limited brings security to your business and your business to you.
